HTML and CSS

GENERAL ASSEMBLY

Agenda

- What is HTML? Why is HTML?
- HTML documents and HTML/CSS syntax
- Making a simple web page!

What is HTML?

HTML stands for:

Hyper**T**ext **M**arkup **L**anguage

The word “markup” implying we’ll write HTML to make our “hypertext” look prettier. Contrast this with “markdown” which makes things look simple.

We’ll be writing HTML so that our web browsers (such as Chrome) can display our websites back to us.

Is HTML a Programming Language?

Is HTML a Programming Language?

NO!

Is HTML a Programming Language?

No! But it is *a language*. HTML is actually read by other programs to translate our documents into viewable web pages.

It's not considered a programming language because it can't do any calculations or operations on its own. It can't do math, have if-statements or for-loops or anything like that.

Flask is the tool we'll use to combine the markup functionality with a real programming language to create dynamic web pages.

HTML Syntax

Chunks of HTML code are delimited with “tags”. For example, the **paragraph tag**:

HTML Syntax

Chunks of HTML code are delimited with “tags”. For example, the **paragraph tag**:

```
<p>Hello World!</p>
```

Actual contents of the tag

 © 2020 General Assembly

HTML Syntax

Some tags are actually “self closing” like the image tag:

```
<img src=”images/doge.png”>
```

HTML Syntax

Some tags are actually “self closing” like the image tag:

```
<img src="images/doge.png">
```

The “source” attribute of the image tag is a link to the image to display

HTML Documents

```
<html>

</html>
```

- The whole document is bound in an HTML tag

 © 2020 General Assembly

HTML Documents

```
<html>

<body>
```

```
</body>
</html>
```

- The whole document is bound in an HTML tag
- The body tag will contain the actual HTML code that our web page will display

HTML Documents

```
<html>
<head>
    <title>GVR Fan Page</title>
    <style>more on this soon</style>
    ... plus other stuff
</head>
<body>
```

```
</body>
</html>
```

- The whole document is bound in an HTML tag
- The **body** tag will contain the actual HTML code that our web page will display
- The **head** tag contains some metadata and add-ons to your page, such as its title, CSS, connections to other CSS docs, connections to JavaScript frameworks, etc.

What is CSS?

CSS stands for **C**ascading **S**tyle **S**heets which is a fancy way to say “code that makes your website look pretty.” CSS gives us a programmatic way to style various parts of our documents. The syntax starts out simple, but its implementation can get very complicated.

CSS Syntax

To style a tag, you state it followed by curly braces:

```
p {

}
```

CSS Syntax

Each property of an HTML tag can be styled here as follows:

```
p {
    color: pink;
    font-style: italic;
    text-align: center;
}
```

Let’s make a page!

As an experiment with HTML and CSS, let’s make a fan page for the one and only Guido van Rossum!
